Gestural Database Etude #1: Embodied Querying, Playing with Past Gestures

Due Sunday February 23rd by 11:59pm

Please create a sonic performance piece that interrogate database content through gestural querying, with the following constraints:

- 1) The piece should meaningfully use: database performance patch connected to a mongoDB database, Fire sound patch, MUBU playback patch.
- 2) Past content retrieved from database should be the primary sound content (i.e. over half) that one hears during performance.
- 3) Create a pdf that details your process and functions as a score that would be legible to me. I should be able to perform the piece without any additional softwares/installs needed.
- 4) Submission: push your git code and pdf by the deadline so that I can access it.
- 5) Demonstrate your performance at the beginning of week 6. *The assignment is not complete unless this is demonstrated in class.*
